

Mapúa SOIT Student Portfolio Dashboard: Data Integration and Visualization

An OJT Project

Presented to the

School of Information Technology

Mapúa University

In Partial Fulfillment

of the Requirements for the Degree

Bachelor of Science in Data Science

by

Christine Julliane L. Reyes

July 2026

ABSTRACT

This practicum report details the 320-hour internal internship completed at Mapúa University's School of Information Technology (SOIT) under the supervision of the BS Data Science Program Coordinator. The primary objective of the training was to conceptualize and develop a comprehensive Student Portfolio Project. Prior to this initiative, student academic data and project artifacts were stored in unstructured and disparate formats, creating administrative friction for faculty attempting to evaluate program effectiveness or showcase student capabilities. To address this opportunity, the internship focused on building a centralized data pipeline. The methodology involved extracting raw student data, executing rigorous data cleaning and structuring utilizing Python and SQL, and designing a robust relational database schema. The structured backend data was then seamlessly integrated into an interactive frontend visualization dashboard. The final output is a dynamic and user-friendly system that allows administrators to efficiently track and evaluate a student's holistic academic journey. Ultimately, the project successfully streamlined student data management for the department and demonstrated the critical importance of backend data integrity in developing reliable data science applications.

CHAPTER 1: COMPANY PROFILE

Company Background

Founded on January 25, 1925, by Don Tomás Mapúa, the first registered Filipino architect and a graduate of Cornell University, Mapúa University (originally established as the Mapúa Institute of Technology) stands as a premier engineering and technological institution in the Philippines. Acquired by the Yuchengco Group of Companies in 2000, it officially attained its university status in 2017. The university operates its main campus in the historic district of Intramuros, Manila, with a prominent satellite campus in Makati City. Mapúa is widely recognized as a pioneer of outcomes-based education (OBE) in the country and holds the distinction of being the first university in Southeast Asia to receive accreditation from ABET. Today, Mapúa continues its legacy of academic excellence by maintaining international partnerships, integrating advanced AI and digital transformation into its pedagogy, and consistently producing top-tier professionals in engineering, architecture, information technology, business, and data science.

Vision

Mapúa University, a global leader in education, fosters sustainable socio-economic growth of society through innovation, digital transformation, and lifelong education.

Mission

The University is committed to:

1. Providing a learning environment in order for its students to acquire the attributes that will make them globally competitive.

2. Engaging in publishable and/or economically viable research, development, and innovation.
3. Providing state-of-the-art solutions to the problems of industries and communities.

Organizational Chart

Figure 1: A basic organizational chart of the School of IT (SOIT) department

CHAPTER 2: TRAINEE

Specific Department

The trainee was assigned to the School of Information Technology (SOIT) under the direct supervision of Ms. Renilda Layno, Program Coordinator for BS Data Science. Her

35 duties involved acting as the lead developer and data analyst for internal university data
36 structuring.

37 **Training Summary & Key Tasks Performed**

38 Over the course of 320 hours, the trainee was tasked with developing a centralized
39 Student Portfolio Project. Key tasks included:

- 40 1. Extracting raw, unstructured student data from backend repositories.
- 41 2. Executing rigorous data cleaning and formatting utilizing Python and
42 Pandas.
- 43 3. Designing an intuitive UI/UX wireframe for the portfolio dashboard.
- 44 4. Integrating the cleaned SQL backend dataset into the frontend visualization
45 interface.
- 46 5. Conducting QA testing, debugging visual anomalies, and drafting final user
47 documentation.

48 **Learnings**

49 During the internship, I acquired advanced technical proficiency in data wrangling
50 using Python and SQL, alongside database schema design and API data integration.
51 Furthermore, I mastered interactive data visualization techniques using tools such as
52 PowerBI and React. In terms of workplace and corporate skills, I developed strong
53 independent problem-solving capabilities and adaptability. I also achieved a high level of
54 time management by consistently rendering fifty-hour work weeks to meet strict project
55 deadlines.

56 **Overall Assessment**

57 The internal internship at Mapúa University was a highly practical and rigorous
58 experience. By acting as the sole developer for the Student Portfolio Project, I gained an
59 end-to-end understanding of the data science lifecycle from backend extraction to frontend
60 visualization. The experience cemented my understanding that data integrity is the
61 foundation of any application. This intensive and project-based setup greatly enhanced my
62 technical confidence and prepared me for fast-paced development roles in the industry.

CHAPTER 3: PROJECT

Project Overview

The project is a dynamic and interactive Student Portfolio Dashboard for the School of Information Technology that centralizes student achievements, academic standing, portfolio evidence, and project history in a single accessible interface. In its current prototype version, the system is presented as the Mapua Student Portfolio Registry, a web-based dashboard that allows public visitors to discover student profiles while providing a separate private administration workspace for profile review and data governance. The prototype contains thirty-three sample student profiles and demonstrates how structured student records can be transformed into a searchable and visually readable dashboard.

Problem/Opportunity

Prior to the proposed system, student information and portfolio artifacts were treated as scattered records rather than as a unified academic data resource. This made it difficult for faculty and administrators to assess a student's holistic academic journey, compare project evidence across program categories, or prepare student capabilities for institutional partners and accreditation-related presentations. The opportunity addressed by the project is the creation of a cleaned, structured, and moderated portfolio pipeline that turns unstructured student data into a reliable frontend dashboard supported by a production-ready relational schema.

Objectives

The first objective of the project is to convert unstructured student data into a dependable relational data model. The prototype demonstrates this objective through normalized student records, course classification, year-level status, portfolio evidence, skills, and moderation states. The supporting SQL schema documents how student identity, academic details, skills, projects, metrics, administrator users, and audit logs may be represented in a production database.

The second objective is to design a usable frontend dashboard that supports both discovery and academic administration. The public-facing interface allows visitors to

search and filter student portfolios by year level, course category, availability, and keywords. The private administration interface, reached through the prototype's admin route, allows authorized users in a future production version to maintain data quality by reviewing, editing, approving, returning, archiving, restoring, and deleting records.

The third objective is to connect the data pipeline to an interface that reflects updates immediately. In the prototype, this is simulated through browser local storage, which persists submitted profiles, administrator edits, approval decisions, returned comments, archived records, and session state. Although the prototype is static, its data structures are intentionally designed so that a backend API and database can replace local storage without redesigning the user workflow.

Significance

The project reduces administrative friction by transforming student profiles into structured, searchable, and moderated records. Faculty and administrators can more easily inspect student capability, monitor the quality of submitted portfolio information, and prepare a more organized view of student work for external partners. The system also benefits students by providing a clearer publication process for presenting skills, projects, and availability in a professional format aligned with Mapua University's academic and institutional identity.

Scope and Limitations

The prototype is scoped to portfolio data for School of Information Technology programs and related computing, data, information systems, information technology, computer science, and media or design-oriented student work. It does not perform live synchronization with external Mapua systems such as Blackboard, nor does it use real cloud authentication, email verification, file uploads, or a hosted production database. For the purpose of the 320-hour deployment, these integrations remain outside the scope, while the prototype focuses on data structuring, dashboard interaction, administrative moderation, and defense-ready documentation.

119 **Output Documentation**

120 The final prototype is documented through the public interface, the private administration
121 route, and the supporting product and database documents stored in the local
122 documentation folder. The following figures describe the major screens and workflows that
123 demonstrate the system from data presentation to administrative governance.

124 **Figure 3.1: Public landing section of the Mapua Student Portfolio Registry**

125 The landing section introduces the Student Portfolio Dashboard as a professional registry
126 for Mapua student work. It uses a school-aligned red, gold, and white visual system and
127 communicates the purpose of the site as a centralized discovery interface for student
128 achievements, academic status, and project evidence. The summary metrics show the
129 number of published profiles, pending submissions, featured projects, and course
130 categories, giving administrators and visitors a quick overview of the current portfolio
131 dataset.

132 This section also establishes the institutional tone of the prototype. Rather than functioning
133 only as a decorative landing page, it immediately frames the website as a data-driven
134 portfolio registry that can support faculty review, partner discovery, and OJT presentation
135 requirements.

136

137 **Figure 3.2: Public directory with search, filters, and student cards**

138 The public directory contains the published student profiles and allows visitors to
139 search by name, program, skills, project details, and other profile content. The directory
140 includes filters for year level, course type, and availability, while sorting options allow
141 records to be arranged by featured status, name, or year level. The current course-type filter
142 focuses on Computer Science, Information Technology, Information Systems, Data
143 Science, and Media and Design, while uncategorized or broader technology records remain
144 visible through the All course types view.

145 Each card is generated from structured data rather than hard-coded profile markup.

146 This supports the project's data-cleaning objective because the same rendering logic can

147 display seed records, approved visitor submissions, or future records loaded from a
148 database-backed API.

149

150

151 **Figure 3.3: Expanded student profile panel**

152 When a visitor selects a student card, the system opens an expanded profile panel
153 that presents the student's name, course category, program, year-level status, role, location,
154 availability, biography, skills, selected outcomes, and featured project work. This view
155 demonstrates how a cleaned student record can be transformed into a readable portfolio
156 summary for faculty, recruiters, mentors, or external partners.

157 The profile panel also includes contact and sharing actions. These actions support the
158 project's purpose of making student capabilities easier to present and circulate while still
159 keeping the profile structure consistent across all students.

160

161 **Figure 3.4: Student publication request form**

162 The public-facing submission form allows students or visitors to request profile
163 publication by entering their name, email, program, year level, portfolio URL, skills, and
164 short biography. To avoid redundant input, the form no longer asks the submitter to choose
165 a separate course-type dropdown. Instead, the prototype infers the course category from
166 the program text and sends the record into the administration queue for review.

167 Submitted profiles are not published immediately. They are stored as pending records so
168 that an administrator can verify, clean, classify, edit, and approve the information before it
169 appears in the public directory. This reflects the need for data governance in an academic
170 portfolio system.

171

172

Figure 3.5: Private administration CMS and moderation workflow

The administration CMS is no longer displayed as a public page section. It is accessed through a private prototype route, such as `index.html#/admin` in local static mode or `/admin` when hosted with an appropriate rewrite rule. The route includes a fake login for demonstration purposes, where any email and password can start an admin session. This simulates authentication without requiring a live identity provider during the prototype defense.

Inside the private CMS, administrators can add new profiles, edit and save existing records, approve pending submissions, return submissions with comments, archive or disapprove records, restore archived profiles, and delete records from the prototype state. The system maintains separate administrative views for submission queues, published portfolios, and archived or disapproved records. Each category includes search and course filter controls and shows the top five records by default, with an option to see more when the list is longer.

The private CMS is intentionally backed by browser local storage in the prototype. This provides session persistence for defense demonstration while clearly separating prototype storage from the production design. In a deployed implementation, local storage should be replaced by the relational database schema, authenticated administrator accounts, server-side validation, and audit logging.

The system architecture separates the public interface, administrative workflow, structured data, and production database plan. The public interface is implemented in `index.html` and styled through `styles.css`, while `app.js` controls rendering, filtering, detail

panels, visitor submission, admin routing, fake login, moderation actions, and local persistence. The production schema defines tables for students, skills, projects, metrics, admin users, and audit logs, allowing the prototype to be defended as a production-shaped system even though it remains dependency-free and locally runnable.

For the defense, the important point is that the prototype demonstrates the complete end-to-end process. A student profile can be submitted through the public website, held as pending data, reviewed in the private admin workspace, edited for quality, approved for publication, returned with comments, archived, restored, or deleted. This workflow directly supports the Chapter 3 objective of linking a cleaned backend data pipeline to a readable dashboard that can update portfolio information in real time within the prototype environment.
